Deriving formal rules from NL regulations?

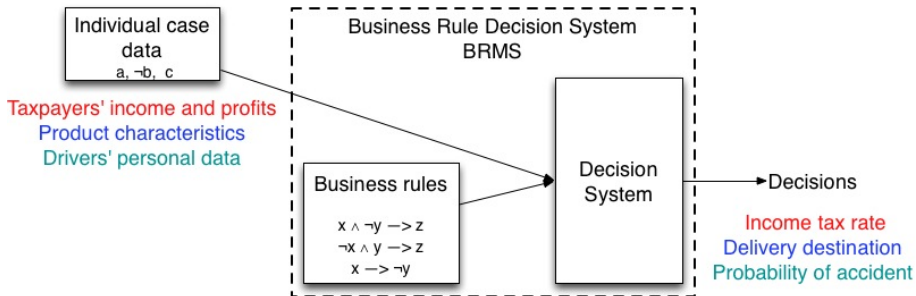

A complex task

- ▶ that cannot be fully automated
- ▶ that can be guided using NLP and semantic web technologies

Context

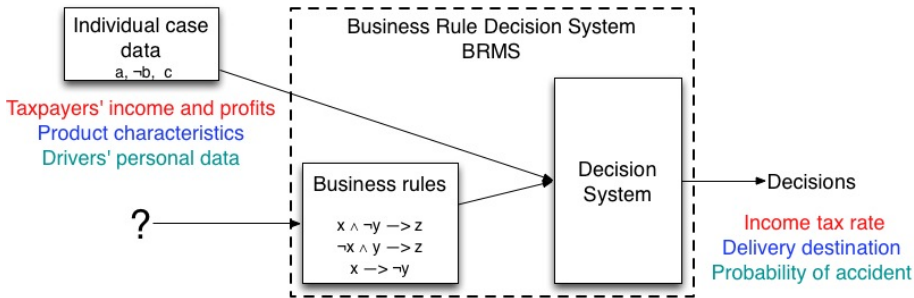

A (Business) Rule Management System takes/suggests decisions on specific cases according to a predefined set of rules.

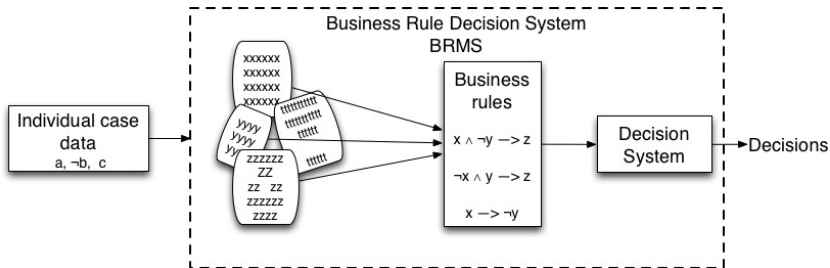

Context

A (Business) Rule Management System takes/suggests decisions on specific cases according to a predefined set of rules.

Integrating NL sources in BRMS

Benefits

- ▶ Knowledge acquisition
- ▶ Documentation of decisions
- ▶ Knowledge base maintenance

Text-based knowledge acquisition

Type of knowledge (domain model)

- ▶ Domain basic knowledge (concepts, entities, relations)
- ▶ Rules that control the decision process

Product Definition

Major metallurgical families and characterization

- ArcelorMittal's range of steels for the automotive sector comprises all the main metallurgical families:
- Steels for drawing: aluminum killed and IF (Interstitial Free);
 - High-strength steels: high yield strength steels, rephosphorized steels, high strength IF steels, isotropic and bake hardening steels;
 - Very high strength multiphase steels: Dual Phase, TRIP, ferrite-bainite, Multiphase steels.

The mechanical properties of these steels are the result of a combination of parameters that are defined throughout the steel manufacturing process. The two main parameters are:

- Chemical composition;
- Thermo-mechanical process.

Mechanical properties

To obtain the required mechanical properties, the steelmaker devises a range of strength/formability combinations suitable for the uses to which products are to be put in the automobile.

A number of hardening processes are available. They can be employed alone or in combination.

Domain concept?

Domain entity?

Business rule?

Domain relation?

Text-based knowledge acquisition

Type of knowledge (domain model)

- ▶ Domain basic knowledge (concepts, entities, relations)
- ▶ Rules that control the decision process

Texts are a convenient source of domain knowledge (\neq Experts)

Texts are a critical source for rule information

- ▶ Legal knowledge is primarily expressed in NL texts

The formalization problem

- ▶ Natural and formal rule languages stand on the opposite extremities of the formalization continuum [Baumeister *et al.*, 2011]
 - ▶ Natural language is intrinsically complex
 - ▶ Factual information and rhetorical elements
 - ▶ Redundant and implicit information
 - ▶ Lexical and structural ambiguity
 - ▶ Understatement and underdetermination
 - ▶ Direct and automatic translation to formal language is impossible
 - ▶ Existing approaches apply on simplified problems
- [Unger *et al.*, 2012] [Dinesh *et al.*, 2008] [Bajwa *et al.*, 2011]

Use cases

- ▶ Arcelor Mittal: assignment of coil products (internal documentation)
- ▶ Audi: certification of seat belts (UNO regulations)
- ▶ American Airlines: calculation of frequent flyer's miles & bonus (AAdvantage Frequent Flier Program)
- ▶ Car rental: terms and conditions checking (SBVR tutorial)

Outline

Outline

Introduction

Overall method of the formalization

- A collaborative and interactive approach

- SemEx, a formalization aiding platform

- Controlled language

Rule extraction

Rule normalization

Rule formalization

Conclusion and Future work

Rule extraction?

It is impossible to directly extract business rules from textual sources

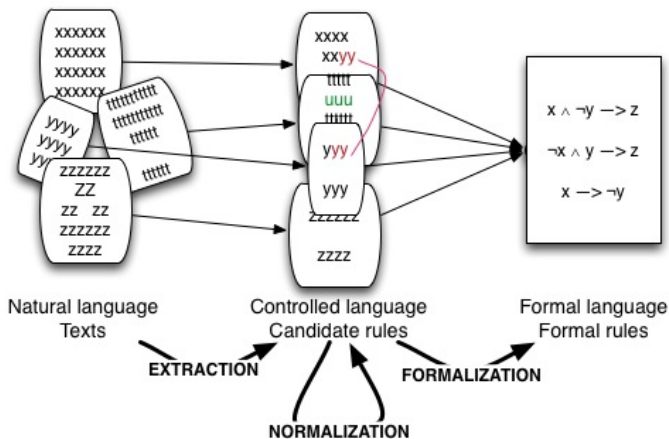

Formalization, a mediated process

Controlled language as a mediator between NL and formal languages

Formalization, a mediated process

Collaboration

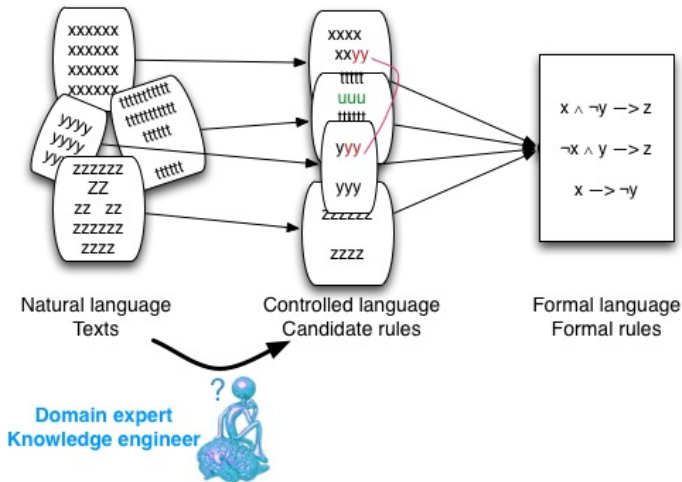

Several actors are usually involved in the acquisition process

- ▶ The domain expert knows the business context and understands the written documentation
- ▶ The knowledge engineer knows how to structure and express knowledge
- ▶ The IT engineer understands how the target decision system works and how to implement the rules

None masters the whole process, from the business case to the detailed system implementation

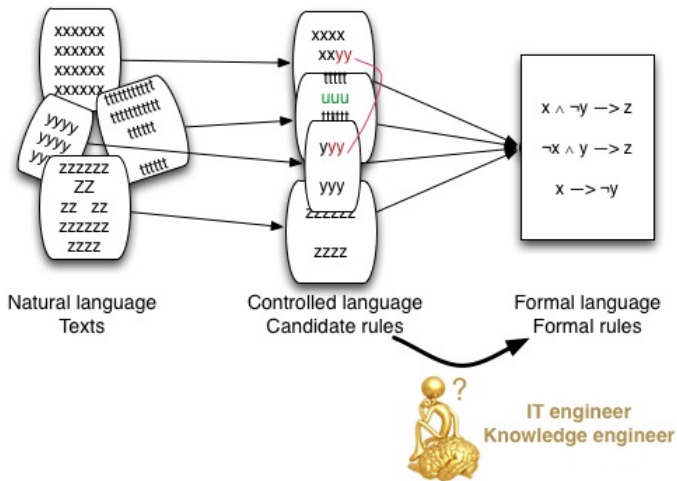

Formalization, a collaborative process

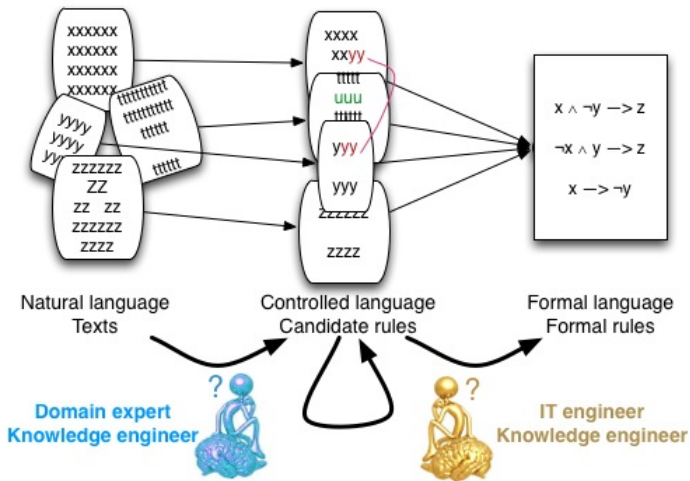

Formalization, a collaborative process

Formalization, a collaborative process

Person-Machine interaction

Human expertise is required for

1. Comprehensive understanding of the source regulation and the target application
 - ▶ Identifying relevant sources of information
 - ▶ Browsing complex documentations
 - ▶ Selecting the text fragments that are relevant for the target application
2. Modeling and formalization
 - ▶ Structuring domain knowledge
 - ▶ Expressing the rules in such a way that they can be properly operated to make decisions

Each rental *has exactly one* renter

Each rental *has one and the same* renter from its beginning to its end

Towards Person-Machine interaction

The acquisition and formalization task is

- ▶ too complex to be fully automated
- ▶ too difficult and time consuming for human experts

An interactive and collaborative approach to help the user

- ▶ exploring the source documentation
- ▶ coping with the semantic difficulties

→ A platform to assist experts in rule acquisition and formalization

Semantic Explorer [Lévy *et al.*, 2010a] [Guissé *et al.*, 2011]

Input Domain lexicalized ontology + NL regulation

Output A documented business rule model

- ▶ A formalization methodology
- ▶ Tools to support human work
- ▶ Standard technologies
 - ▶ Eclipse application
 - ▶ W3C languages ensuring interoperability

OWL, SKOS, RDF, RDAa, SPARQL

Role of controlled language

The controlled language is used to

- ▶ Describe the domain model
 - ▶ conceptual model (specialized vocabulary, ontology)
 - ▶ rules (prescribed, suggested or self-imposed rules)
- ▶ Specify the expected behavior of the rule system
- ▶ Verbalize that model in a way that is understandable to domain experts

A basic controlled language

Statements

- ▶ Concept definitions: restrictions on the content of terms
- ▶ Operative rules: prescribed, suggested, self-imposed rules

ProducedCoil : Coil *that is produced by* the Galvanization Line
It is obligatory that yield strength *is between* the upper and lower values

Elements

- ▶ Conceptual terms: Width Thickness Company Coil
- ▶ Individual terms: ArcelorMittal Coil #13 Galvanization Line
- ▶ Relational terms: *belongs to*
- ▶ Keywords: *that*
- ▶ Modal operators: *It is obligatory that* *must*

Outline

Introduction

Overall method of the formalization

Rule extraction

Semantic annotation

Rule selection

Rule normalization

Rule formalization

Conclusion and Future work

1st step: annotation wrt. an ontology

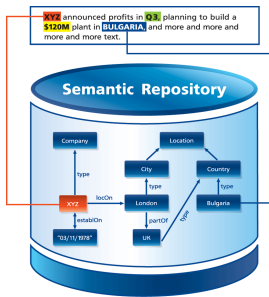

~~0 Rule extraction~~

1 Semantic annotation wrt. ontology

What is semantic annotation?

- ▶ Text annotation: metadata attached to fragments of a text
grade, comment, explanation, presentational markups
- ▶ Semantic annotation: the metadata belong to a specific resource
controlled vocabulary, terminology, gazetteer, thesaurus, ontology

[Popov *et al.*, 2004]

Types of semantic annotation

- ▶ Initial focus on instance annotation and ontology population [Vargas-Vera *et al.*, 2002] [Popov *et al.*, 2004] [Amardeilh *et al.*, 2005][Magnini *et al.*, 2006]
- ▶ Towards a richer semantic annotation [Ma *et al.*, 2010]
 - ▶ Fine-grained annotation
 - ▶ Exploitation of all the full semantics of ontologies [Lévy *et al.*, 2010b]
individuals, concepts, roles/relations, rules

Annotation wrt. an ontology

AAdvantage **flight mileage credit** is determined on the basis of nonstop distances between the **airports** where your **flight** originates and terminates.

On **connecting flights**, you'll receive **mileage credit** for each **segment** of your trip ;
on **single-plane flights**, you'll receive the nonstop origin-destination **mileage**.

Mileage credit cannot be earned for the same **flight** in more than one of the following **programs**:
the **AAdvantage program** or any other **loyalty program** in which **American Airlines** participates.

Lexicalized ontology

[Omrane *et al.*, 2011a]

```
<rdf:Description rdf:about="http://lipn.univ-paris13.fr/RCLN/terminae/Audi#SeatBelt">  
  <skos:prefLabel>seat belt</skos:prefLabel>  
  <skos:altLabel>belt</skos:altLabel>  
  <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#Concept"/>  
</rdf:Description>
```

Semantic annotator

Java module

- ▶ Originality
 - ▶ Can take any ontology as input
 - ▶ Can process pre-annotated corpora
- ▶ Current version
 - Input** Text + Lexicalized ontology (lexical items)
 - Output** Text with individual and concept mentions annotated
- ▶ Future version
 - ▶ Role annotations
 - ▶ Lexicalized ontology with lexico-syntactic patterns
 - ▶ UIMA module

SemEx navigation perspective

The screenshot displays the SemEx application window. On the left, a 'Hierarchy' pane shows a tree structure of concepts. The 'Attribute' category is expanded, showing sub-categories like 'Safety', 'Humidity', 'Temperature', 'Number', 'Device', 'Dimension', 'Conditioning', and 'Method'. Under 'Method', 'PhysicalMethod' is expanded, showing 'ResistanceTest', 'PhysicalSeatBeltTest', 'TrolleyTest', 'TensileTest', 'BreakingStrength', 'ExposureTest', 'MicroSlipTest', 'CorrosionTest', and 'FixtureTest'. The 'PhysicalSeatBeltTest' is selected. Below the hierarchy are 'Concepts' and 'Properties' tabs. The main 'Corpus' pane on the right shows a text document with a file path: '/Users/fl/home/Irecherche/LN/corpus/ontorules/2011-02-24et25Review meeting/demoQuery4/resources/semantics/AudiMiniRFDa.html'. Below the path is a search bar labeled 'Ontological entity'. The text content is a list of numbered items (7.3, 7.3.1, 7.3.2, 7.3.3, 7.3.4, 7.3.5) describing a 'Micro-slip test' and its requirements, with various terms highlighted in blue and red.

Rule Editor Navigator

Concepts Properties

Corpus

/Users/fl/home/Irecherche/LN/corpus/ontorules/2011-02-24et25Review meeting/demoQuery4/resources/semantics/AudiMiniRFDa.html

Ontological entity

7.3. **Micro-slip test** (see Annex 11, figure 3 to this **Regulation**).

7.3.1. **[R1]** The samples to be submitted to the **micro-slip test** shall be kept for a minimum of 24 hours in an **atmosphere** having a **temperature** of 20 + 5 C and a relative **humidity** of 65 + 5 per cent. **[R13]** The **test** shall be carried out at a **temperature** between 15 and 30 C.

7.3.2. It shall be ensured that the free section of the **adjusting device** points either up or down on the **test bench**, as in the **vehicle**.

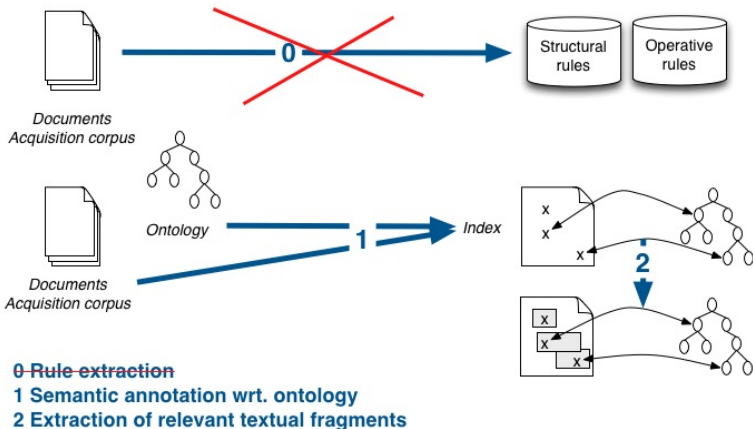

7.3.3. **[R18]** A 5 **daN** load shall be attached to the lower end of the section of **strap**. **[R18]** The end shall be subjected to a back and forth motion, the total amplitude being 300 + 20 mm (see figure).

7.3.4. If there is a free end serving as reserve **strap**, it must in no way be fastened or clipped to the section under load.

7.3.5. It shall be ensured that on the **test bench** the **strap**, in the slack position, descends in a concave curve from the **adjusting device**, as in the **vehicle**. The 5 **daN** load applied on the **test bench** shall be guided vertically in such a way as to prevent the load swaying and the **belt** twisting. The attachment shall be fixed to the 5 **daN**

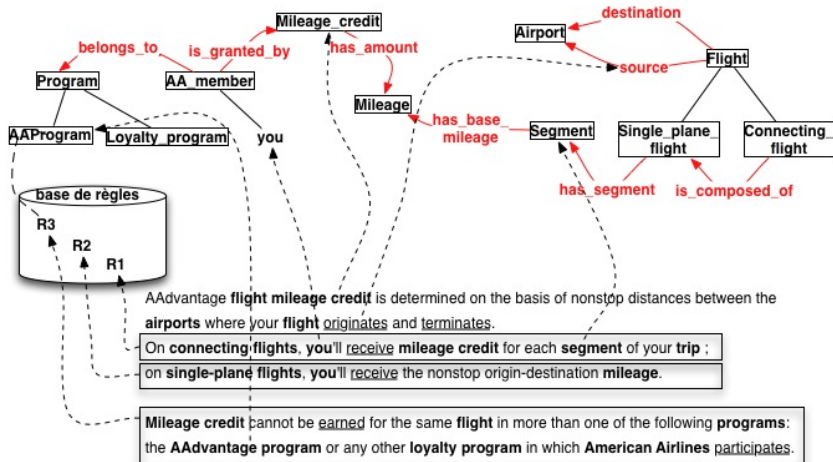

2nd step: Rule selection

Annotation wrt. an ontology and a rule base

How to guide rule selection?

Rule selection requires good knowledge of the business context and thorough understanding of the source documentation

It relies on human expertise but

- ▶ Semantic annotation enhances text browsing

How to guide rule selection?

Rule selection requires good knowledge of the business context and thorough understanding of the source documentation

It relies on human expertise but

- ▶ Semantic annotation enhances text browsing
 - ▶ Sentences with at least one annotation
 - ▶ American Airlines: recall = 39%, low precision
 - ▶ Audi: recall = 72%, low precision

How to guide rule selection?

Rule selection requires good knowledge of the business context and thorough understanding of the source documentation

It relies on human expertise but

- ▶ Semantic annotation enhances text browsing
- ▶ Keywords help identifying relevant text fragments

How to guide rule selection?

Rule selection requires good knowledge of the business context and thorough understanding of the source documentation

It relies on human expertise but

- ▶ Semantic annotation enhances text browsing
- ▶ Keywords help identifying relevant text fragments
 - ▶ Audi use case
 - ▶ Single keyword: 100% of recall, 80% of precision
 - ▶ Combination of keywords (*shall + if*): 97% of recall, 95% of precision

How to guide rule selection?

Rule selection requires good knowledge of the business context and thorough understanding of the source documentation

It relies on human expertise but

- ▶ Semantic annotation enhances text browsing
- ▶ Keywords help identifying relevant text fragments
- ▶ The expert can run Sparql queries combining regular expressions and semantic tags

SPARQL queries

Find the sentences containing at least one of the keywords **shall** or **if** and annotated by the concept Upgrade

```
PREFIX schema: <http://lipn.univ-paris13.fr/RCLN/schema#>
PREFIX AA: <http://lipn.univ-paris13.fr/RCLN/terminae/AAdvantage#>
select DISTINCT ?sentence ?text
where{
  ?sentence rdf:type schema:Sentence.
  ?sentence schema:content ?text.
  filter (?text ~ "_shall_" || ?text ~ "_if_")
  ?sentence schema:annoted ?textlink.
  ?textlink schema:defineResource ?resource2.
  ?resource2 schema:realizeConcept AA:Upgrade
}
```

Rule selection, a complex but crucial task

► Problems

- Corpus variability: extraction patterns are not equally relevant for all corpora
- Focus must be put on recall rather than on precision but overloading the text with annotations hinders browsing

► A crucial step for bootstrapping the annotations of rules

► Future work: the interactive learning of selection patterns

Outline

Introduction

Overall method of the formalization

Rule extraction

Rule normalization

Goal

Normalization operations

Lexical normalization

Decontextualisation

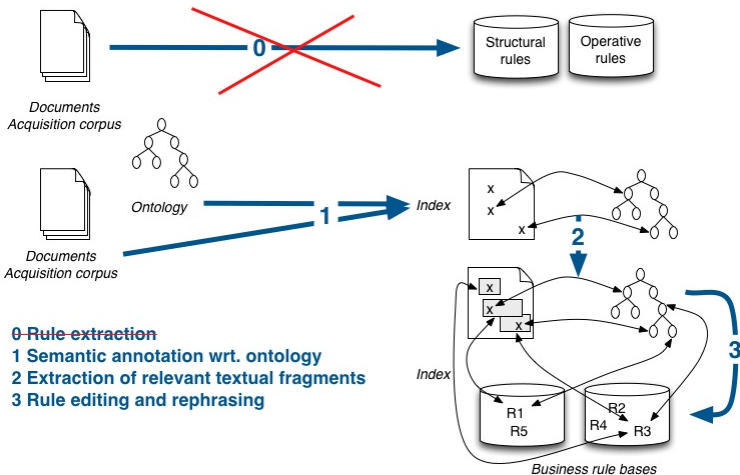

Syntactic normalization

Semantic restoration

Normalization output

Goal

Lexical normalization

- Goal**
- ▶ Checking the domain vocabulary of a candidate rule
 - ▶ Replacing all the mentioned terms by their preferred forms
 - ▶ Disambiguating the ambiguous terms

- Method**
- ▶ Automatic semantic annotation
 - ▶ Manual revision

Decontextualization

Co-reference links must be broken and the actual referent be made explicit so that the rules can be understood independently of their context

- ▶ Pronouns

*All the adjustment devices shall undergo a strength test [...]. **They** must not break [...].*

- ▶ Generic business terms

*The samples to be submitted to the micro-slip test [...]. **The test** shall be carried out at a temperature [...].*

- ▶ Reference keys

Syntactic normalization

- ▶ Sentence reordering

*Upgrades **are void if** sold for cash or other consideration.*

***If** upgrades are sold for cash or other consideration, these upgrades are void.*

- ▶ Splitting enumerations

- ▶ Splitting rules

Semantic restoration

Due to decontextualization or syntactic normalization, some implicit discourse entities have to be restored

- ▶ Restoring an entity to solve a reference
- ▶ Restoring an interval to express constraints

*The breaking load shall be determined within 5 minutes **after** the strap is removed from [...].*

***The determination time** is the time when the breaking load is determined. The **removing time** is the time when the strap is removed from [...]. The **delay between the removing time and the determination time** will be less than 5 minutes.*

Detailed analysis on 2 candidate rule samples

► American Airlines: 95 candidate rules

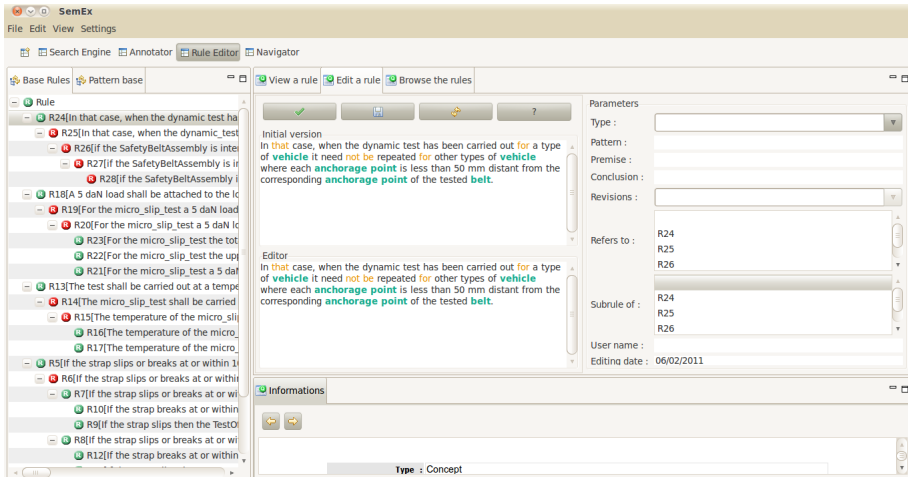

Normalization operations	% of normalized candidate rules
Lexical	65%
Contextual	64%
Syntactic	100%
→ <i>Decomposition</i>	30%
→ <i>Restructuration</i>	68%

► Audi : 100 candidate rules

Normalization operations	% of normalized candidate rules
Lexical	61%
Contextual	57%
Syntactic	100%
→ <i>Decomposition</i>	40%
→ <i>Restructuration</i>	32%

SemEx rule editor perspective

An iterative process

Input A set of textual fragments extracted from the source text (NL)

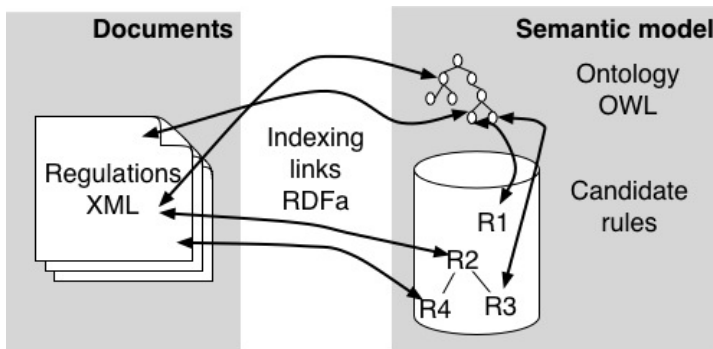

Process A sequence of normalization operations applied on each fragment (Human control)

Output A set of rule statements that are independent, decontextualized, unambiguous, (possibly) structured into premise and conclusion
A derivation tree of candidate rules (Controlled Language)

IF a test has a duration less than 6 hours, THEN the test is InvalidTest

Underlying index structure

A documented rule model

Outline

Introduction

Overall method of the formalization

Rule extraction

Rule normalization

Rule formalization

- Turning CR into decision rules

- Consistency checking

Conclusion and Future work

Further semantic transformation

The business expert in charge of the normalization of rules often cannot achieve their semantic transformation

- ▶ His/her job is to clarify the business knowledge
- ▶ He/She is usually not aware of the details of
 - ▶ the implementation language
 - ▶ the way the rules must be finally encoded to be machine processable

New semantic operations are required to describe the real business processes (expected vs. deviant)

Decision rules

- ▶ Taking a decision = choosing an action in a set of possible actions
- ▶ A decision rule
 1. the set of actions among which one must be chosen
 2. the triggering conditions of the decision rule
 3. the action to be undertaken

Decision formalization method

- ▶ Approach
 - ▶ Splitting problems
 - ▶ Relying on decision variables
- ▶ A two-step process
 1. Create a **detection rule** stating that a decision has to be taken
 - Premise same conditions as a standard rule
 - Conclusion a decision variable
 2. Create a **decision rule** associating a decision to a decision variable
 - Premise a decision variable + (specific sub-conditions)
 - Conclusion an action

Example

Candidate rule The car must *be returned* at the return branch

Detection rule If the drop-off location of a rental is not the return branch of the rental , the rental is *elsewhere-returned*

Decision variable the rental is *elsewhere-returned*

Decision rule If the rental is *elsewhere-returned* then ACTION

- ▶ Breaking: “cancel the rental” or “end the rental”
- ▶ Re-trying: ask the renter to drop-off in the right place
- ▶ Repairing: “charge a penalty”

Consistency checking

Non process is error prone

- ▶ Extraction: long-distance dependencies
- ▶ Normalization: interpretation inconsistencies
- ▶ Formalization: formal inconsistencies [Fink *et al.*, 2012]

The index structure supports consistency analysis [Nazarenko and Lévy, 2013]

- ▶ Select all the candidate rules with the concept C in the premise
- ▶ Select all the candidate rules derived from sentences with the word W
- ▶ Select all the candidate rules derived from the candidate rule CR

Outline

Introduction

Overall method of the formalization

Rule extraction

Rule normalization

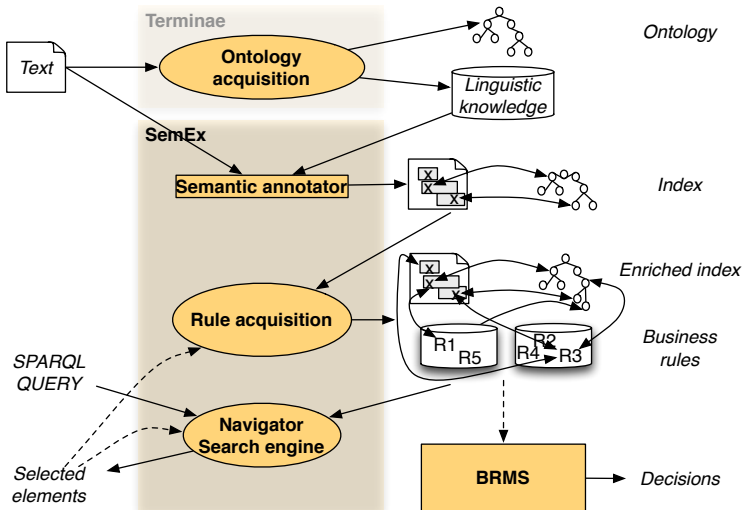

Rule formalization

Conclusion and Future work

Documented BR Model

Overall architecture

Integrating LN sources in decision systems

Of course, human expertise is required for

- ▶ Understanding the business case (documentation & target application)
- ▶ Building the relevant domain ontology [Omrane *et al.*, 2011b]
- ▶ Selecting the relevant rule fragments in the source documentation
- ▶ Rephrasing those NL fragments into CL and formal statements
- ▶ Modeling and formalizing the candidate rules wrt. the target application

but the Documented rule model integrates NL sources in rule systems

- ▶ Acquisition of rule that are anchored in source NL regulations
- ▶ Traceability of the rule base and system decisions
- ▶ Joint maintenance of the NL regulations and the knowledge base

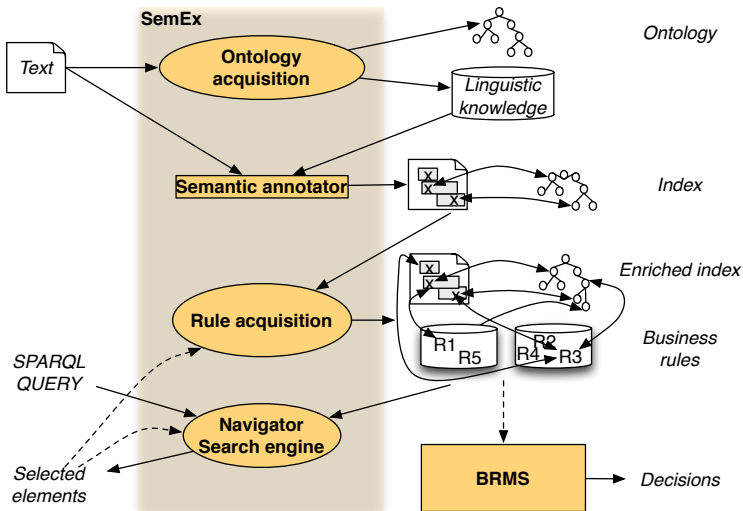

Further assistance to formalization

- ▶ Current SemEx platform
 - ▶ Overall methodology
 - ▶ Set of normalization operations
 - ▶ Semantic and keyword annotation
 - ▶ Interfaces
- ▶ Future work
 - ▶ Integration of NLP tools
 - ▶ Anaphora detection and resolution
 - ▶ Syntactic pattern recognition
 - ▶ Syntactic transformation
 - ▶ Stronger controlled language
 - ▶ Syntactic validation of the resulting candidate rules
 - ▶ Semantic conformance wrt. the underlying semantic model
 - ▶ Dynamic updating of the ontology
 - ▶ Machine learning of patterns

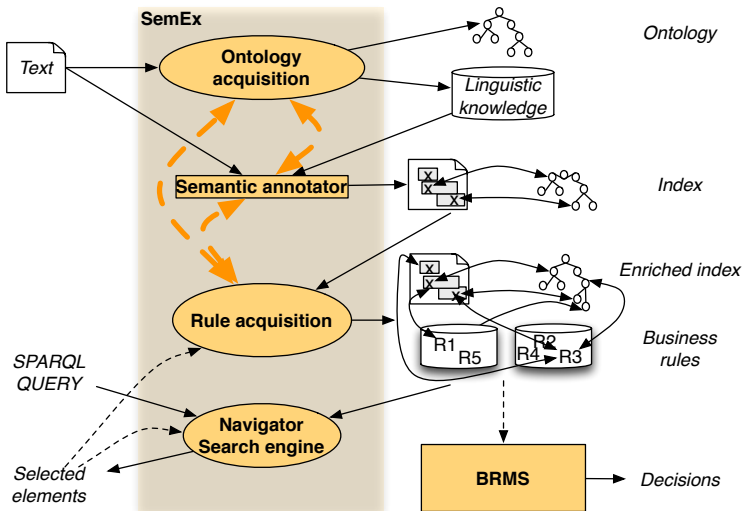

Dynamic updating of the ontology

Dynamic updating of the ontology

Machine learning of patterns

- ▶ Rule detection
 - ▶ It relies mainly on combinations of indices
 - ▶ Those indices and their importance vary from one corpus to another
- ▶ Rule normalization
 - ▶ The same patterns of rule are transformed in the same way
- ▶ Consistency checking

→ Towards interactive and incremental machine learning

Thank you for your attention
